measurement problem in a way it claims it does. Since the following is

supposed to be a final proof, I don't want it to be lost among many

Load applied at an angle

other posts in the thread above. That's why I open a separate thread.

How to find E field when H field

is given

Proof that thermal

interpretation of QM is wrong

Here I want to prove that the thermal interpretation, contrary to its
 claim, cannot solve the measurement problem. For definiteness I will

present the measurement problem in the form of the Schrodinger cat

paradox, but it can be presented in other forms as well. I will prove that

the Schrodinger cat "paradox" is a true paradox within the thermal
 interpretation that does not have a solution within that interpretation.

where  $\text{Tr}_{\text{no cat}}$  denotes the trace over all degrees of freedom except the degrees of freedom of the cat. Since  $\rho^{(\text{cat})}$  describes an open system, its dynamics is very complicated and nonlinear. Since the details of its environment "no cat" degrees of freedom on the cat are not known in practice, the evolution of  $\rho^{(\text{cat})}$  in practice can be described by stochastic equations. The thermal interpretation conjectures (without an actual proof) that this complicated, nonlinear and effectively stochastic evolution can explain why the superposition of an alive and a dead cat is unstable, so that the system exhibits a fast decay towards an either dead cat or alive cat. Here I prove that this conjecture is wrong.

🔗 **SHARE THIS PAGE**

The central idea of my proof is to consider the problem from the point

🗨 **LATEST THREADS**

of view of the whole Universe, instead from the point of view of the cat.

Even though the whole Universe is in principle much more complicated

R [do electric magnetic waves moving in upside down form?](#)

than the cat, this actually simplifies the analysis because it is known that the whole universe evolves unitarily, given by the unitary evolution

 [operator](#)  
[What does the constancy of light of speed mean?](#)

$$U(t) = e^{-iHt}$$

M [Load applied at an angle](#)

 where  $H$  is the Hamiltonian of the Universe.  
[How to find E field when H field is given ?](#)

### The proof

 [Proof that thermal interpretation of QM is wrong](#)

Let  $\rho(t)$  be the density matrix of the whole Universe. In general, it

evolves with time according to  $\rho(t) = U(t)\rho(0)U^\dagger(t)$

Join Physics Forums Today!  
The friendliest, high quality science and math community on the planet! Everyone who loves science is here!

Now suppose that initially  $\rho(0) = \rho_{\text{alive}}$ , where  $\rho_{\text{alive}}$  is the state of the Universe with an alive cat. The alive state is stable, i.e. the cat who is initially alive will stay alive for a long time. Hence we can write

$$U(t)\rho_{\text{alive}}U^\dagger(t) = \rho_{\text{alive}}(t)$$

» **PHYSICS FORUMS VALUES** of the Universe with a cat alive during a long time. Similarly, if initially  $\rho(0) = \rho_{\text{dead}}$  then we have a dead cat for a long time, so

**We Value Quality** we can write

- Topics based on mainstream science
- Proper English grammar and spelling

**We Value Civility**

- Positive and compassionate attitudes
- Patience while debating

**We Value Productivity**

- Disciplined to remain on topic
- Recognition of controversial issues
- Solo and co-operative problem solving

But what if initially we have the superposition of a dead and an alive cat? It is certainly possible as an initial condition, but the question is what happens with such a superposition later? Is it stable or unstable?

To simplify the analysis we shall assume that the initial superposition is incoherent, i.e. that

SHARE THIS PAGE

$$\rho(0) = \frac{1}{2}\rho_{\text{alive}} + \frac{1}{2}\rho_{\text{dead}}$$

without the interference term. (We shall show later that inclusion of the interference terms does not change the final results.) Hence the

R

linearity of evolution for the whole Universe implies

moving in upside down form?

$$U(t)\rho(0)U^\dagger(t) = \frac{1}{2}\rho_{\text{alive}}(t) + \frac{1}{2}\rho_{\text{dead}}(t)$$

What does the constancy of light of speed mean?

M

This proves that the superposition is stable, i.e. that there is no decay to  $\rho_{\text{alive}}(t)$  or  $\rho_{\text{dead}}(t)$ .

How to find E field when H field is given?

Now what about beables in the thermal interpretation? All beables in the thermal interpretation are of the form

Proof that thermal interpretation of QM is wrong

$$\langle O(t) \rangle = \text{Tr} O \rho(t)$$

where  $O$  are hermitian observables. So if  $O$  is a cat observable that describes some actual properties of the cat, we see that the actual property of the cat is

[Join Physics Forums Today!](#)

The friendliest, high quality science and math community on the planet! Everyone who loves science is here!

$$\langle O(t) \rangle = \frac{\langle O(t) \rangle_{\text{alive}} + \langle O(t) \rangle_{\text{dead}}}{2}$$

## » PHYSICS FORUMS VALUES

which is neither  $\langle O(t) \rangle_{\text{alive}} = \text{Tr} O \rho_{\text{alive}}(t)$  nor

~~$\langle O(t) \rangle_{\text{dead}} = \text{Tr} O \rho_{\text{dead}}(t)$~~ . This proves that beables of the thermal

- Top level based on mainstream science
- Proper English grammar and spelling
- Straightforward generalization of this proof, one can see that thermal interpretation cannot resolve the measurement problem of quantum physics in general.

## » We Value Productivity

- Disciplined to remain on-topic
- Recognition of own weaknesses
- Solo and co-op problem solving

Note that the cat beable can also be written as

## » SHARE THIS PAGE

$$\langle O(t) \rangle = \text{Tr}_{\text{cat}} O \rho^{(\text{cat})}(t)$$

where  $\rho^{(\text{cat})}(t)$  (given by the first equation in **Introduction** above)

satisfies a nonlinear equation and  $\text{Tr}_{\text{cat}}$  denotes tracing over cat

degrees of freedom. The thermal interpretation conjectures that this

nonlinearity can somehow cause the decay towards an either dead or

alive cat. What our proof shows is that this conjecture is not true, which

is a consequence of the fact that the Universe as a whole obeys a linear

evolution. No matter how complicated and apparently stochastic

behavior of a subsystem may be, the unitary evolution of the whole

Universe implies that it cannot solve the measurement problem within

the thermal interpretation.

Load applied at an angle

Finally, a note on the ignored interference terms. If the initial state of the Universe is a coherent superposition

$$\frac{|\text{alive}\rangle + |\text{dead}\rangle}{\sqrt{2}}$$

then the initial  $\rho(0)$  has the additional interference term

$$\rho_{\text{interf}} = \frac{1}{2} |\text{alive}\rangle \langle \text{dead}| + \frac{1}{2} |\text{dead}\rangle \langle \text{alive}|$$

[Join Physics Forums Today!](#)

The friendliest, high quality science and math community on the planet! Everyone who loves science is here!

In principle this contributes to beables via terms of the form

» **PHYSICS FORUMS VALUES**  $\text{Tr}O|\text{alive}\rangle\langle\text{dead}|$

#### 🏠 We Value Quality

- Topics based on mainstream science
- Properly cited, then terms of the

#### ♥ We Value Civility

However, if  $O$  is an observable that distinguishes a dead cat from an alive one, then terms of the above form are negligible. For instance, if the dead cat is distinguished from an alive one by having a closed/open eye, then  $O$  can be taken to be the position operator  $x$  describing the position of the eyelid, while  $|\text{alive}\rangle$  and  $|\text{dead}\rangle$  are proportional to two different eigenstates of  $x$ , in which case it's easy to see that the term above vanishes.

In your final note, which is the only part relevant to the problem, you assumed the link between measurement results of  $O$  and eigenstates, which is not valid in the thermal interpretation.

That's not essential at all. Alternatively, I can take  $|\text{dead}\rangle$  and  $|\text{alive}\rangle$  to be proportional to two macroscopically different coherent states  $|p, x_1\rangle$  and  $|p, x_2\rangle$ , in which case my argument that the interference term is negligible applies without having position eigenstates.

If you are suspicious about cats (despite the fact that Schrodinger proved that it is possible if Schrodinger equation is always true) , consider spin in a superposition up and down. The proof doesn't change.

» **PHYSICS FORUMS VALUES**

That's harsh and also unhelpful (I think). It's true that there aren't

actual states  $|alive\rangle$  and  $|dead\rangle$ , but is this oversimplification

important for the point @Demystifier is making? If so, can you show

how a more careful treatment of cats would lead to a different

conclusion? If not, then your remark is unhelpful.

**We Value Quality**

What I think a more careful treatment would like is something like this:

• Recognition of own weaknesses

• Solo and co-op problem solving

Presumably, a macroscopic configuration (a description at the level of cats and cyanide canisters) corresponds to some equivalence class of

microstates. Some microscopic states are incompatible with

there being a live cat. So I assume that for a macroscopic configuration

$c$  (a description of the locations, types, shapes, and health of cats and so

forth) there is a corresponding projection operator  $\Pi_c$  such that if

microstate  $|\psi\rangle$  is compatible with configuration  $c$ , then  $\Pi_c|\psi\rangle = |\psi\rangle$ ,

and if  $|\psi\rangle$  is incompatible with  $c$ , then  $\Pi_c|\psi\rangle = 0$ .

Then instead of talking about the states  $|alive\rangle$  and  $|dead\rangle$ , we can talk about the projection operators.

$$\rho(0) = \frac{1}{2}\rho_{\text{alive}} + \frac{1}{2}\rho_{\text{dead}}$$

$$U(t)\rho(0)U^\dagger(t) = \frac{1}{2}\rho_{\text{alive}}(t) + \frac{1}{2}\rho_{\text{dead}}(t)$$

This proves that the superposition is stable, i.e. that there is no decay to

$\rho_{\text{alive}}(t)$  or  $\rho_{\text{dead}}(t)$ .

I don't know about the thermal interpretation, but in some interpretations of quantum mechanics, the density matrix is interpreted to include subjective uncertainty. So being a mix of "alive" and "dead" is compatible with the cat being alive or dead, and you just don't know which (until you peek, to resolve the subjective uncertainty).

do electricmagnetic wave moving in upside down form?

If you consider the "density matrix of the universe" to be the most complete information there can be about the state of the universe, then I guess that out isn't possible.
